[PROFILE](#)

DevOps is a special approach to development that automates workflows and delivers finished IT products faster.

DevOps is also a distinct approach to organizing development teams. Its essence is that developers, testers and administrators work in a single stream - they are not responsible for their stage, but together they work on the release of the product and try to automate the tasks of their departments so that the code moves between stages without delay. In DevOps, responsibility for the outcome is shared among the entire team.

For DevOps to work, you need to establish continuous communication - a pipeline between developers, testers, and administrators. This requires automation tools to help you more efficiently transfer code, test it, and deploy it to servers.

What development problems do DevOps services help solve?

Low release speed.

When a new feature is developed for two months, it is tested for another month, and then it still doesn't work. Or an application has been in development for a year, and after the release, it turns out that no one needs it in this form. One of the tasks of DevOps consulting is to quickly release an application to the market and respond flexibly to changes: bugs, competitors' releases, user requirements.

Errors in testing and at startup.

In the classic approach, developers, testers, and administrators work on machines with different configurations. Because of this, it happens that the tester has no errors, and the application does not work on the "production" server. In addition, since a lot is done manually, there is a risk of errors in the transfer of the code.

Using the DevOps services creates a common environment for development, testing and launching, with common configurations. And the transfer of the code occurs automatically, which negates the influence of the human factor and reduces the likelihood of errors.

Issues with bug fixes and updates.

With the classical approach to development, problems with the application are solved for a very long time. First, administrators collect data on errors and user complaints, then pass them on to developers. Tasks fall on the waiting list, and sometimes they are started too late. Then long testing, tuning on servers - and by this time a new batch of requirements and errors may have formed.

The DevOps companies employ automated monitoring systems that continually send bug reports. The pipeline allows you to sometimes release several updates a day, instantly solving application problems.

Excessive spending.

With the classical approach, the development cost is constantly growing due to lengthy programming and testing processes, errors, rollbacks and fixes. In addition, many processes are done manually, that is, qualified specialists spend their precious time on routine.

Effective use of DevOps consultant solves this problem. Development takes fewer hours, and the entire routine is automated - as a result, it requires less human resources and less money.
